

HTTP API object "eventanimalattendance"

Examples

Action add

```
$data = array(
    "token" => $token,
    "tokenHash" => $tokenHash,
    "objectType" => "eventanimalattendance",
    "objectAction" => "add",
    "values" => array(
        array(
            "attendanceEventID" => $validEvent,
            "attendanceAnimalID" => $validAnimal,
            "attendanceStatus" => "Not Attending",
        ),
    ),
);
```

Action edit

```
$data = array(
    "token" => $token,
    "tokenHash" => $tokenHash,
    "objectType" => "eventanimalattendance",
    "objectAction" => "edit",
    "values" => array(
        array(
            "attendanceID" => $validPK,
            "attendanceEventID" => $validEvent,
            "attendanceAnimalID" => $validAnimal,
            "attendanceStatus" => "Attending",
        ),
    ),
);
```

Action publicSearch

Search for animal attendance information. In this example, we use the event's eventID to find animal attendance information.

```
$data = array(
    "apikey" => "lXxJFhSB",
    "objectType" => "eventanimalattendance",
    "objectAction" => "publicSearch",
    "search" => array (
        "resultStart" => 0,
        "resultLimit" => 20,
        "resultSort" => "attendanceID",
        "resultOrder" => "asc",
        "filters" => array(
            array(
                "fieldName" => "attendanceEventID",
                "operation" => "equals",
                "criteria" => "7",
            ),
        ),
        "fields" => array("attendanceEventID", "attendanceAnimalID", "attendanceStatus")
    ),
);
```

Action publicView

Retrieve attendance information for a specific attendanceID.

```
$data = array(
    "apikey" => $publicApiKey,
    "objectType" => "eventanimalattendance",
    "objectAction" => "publicView",
    "values" => array (
        array("attendanceID" => "166054"),
    ),
    "fields" => array("attendanceEventID","attendanceAnimalID","attendanceStatus", "animalName",
"animalNotes")
);
```
